```
of known amino acid sequence in a parent polypeptide e.g. human growth hormone (hGH) which has been cloned and has a pre-identified biological activity, where the active domain interacts with a target when the parent polypeptide is in its native-folded formed the interaction is responsible for the biological activity comprising: (a) comparing the amino acid sequence of polypeptide structure in the region of known amino acid sequence or polypeptide structure in the region of known amino acid sequence of an analogue polypeptide (e.g. prolactin, placental lactogen or porcine growth hormone) which has at least 15% homology with hGH alpha-carbon coordinates within about 2-3.5 angstroms of hGH alpha-carbon coordinates for about 60% of the analogue sequence, where any interaction of the analogue with the target is different from target interaction with hGH;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (b) substituting DNA encoding an analogous polypeptide segment from the analogue into DNA encoding the full length hGH, and expressing a analogue into DNA encoding the full length hGH, and expressing a polypeptide with the target to determine interaction; (d) repeating steps (b) and (c) with a second analogous polypeptide segment; and (e) omparing the difference between activity of the first and second segment-substituted polypeptides as an indication of the location of the unknown active domain in hGH. The method is useful for determining the relationship between structure and function of known polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to identifying an unknown active domain in a region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         acid sequence by substituting analog segments into the parent polypeptide is useful to determine the relationship between structure and function
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying active domains within cloned polypeptides of known amino

(pref. formed by subtstn. of Met-14 with Leu) and a foreign protein. Stability of the vector in the host is greatly increased so the protein yield is higher.

This invention describes novel human anti-anglogenic peptides derived from 10 to 150 consecutive amino acids selected from the N-terminal end of from 10 to 150 consecutive amino acids selected from the N-terminal end combined by the consecutive amino acids selected from the N-terminal end combined by the consecutive Human; anti-angiogenic; prolactin; placental lactogen; hPL; angiogenesis; growth hormone, hGH-V; capillary endothelial cell proliferation: placental vascularisation; pregnancy; treatment: angiogenic disease; tumour; inhibitor; maliqnant; angiofibroma; arteriovenous maliormation; arthritis; atherosclerotic plaques; corneal graft neovascularisation; granulation; glaucoma; ocular, uveitis; fracture; osler-Weber syndrome; psoriasis; fibroplasia; scleroderma; Kapc i's sarcoma; vascular adhesion; dler; letakemia; reproductive disorder; contraceptive agent; gene therapy; pre-eclampsia; intrauterine growth retardation; placental dysfunction. New anti-angiogenic peptides - comprise N-terminal fragments of human placental lactogen, human growth $h\varepsilon$ mone, growth hormone variant or human prolactin Weiner RI; Human anti-angiogenic peptide hGH Met-1Phe191. Taylor R, AAW92264 standard; Protein; 192 AA Example 3; Page 49; 87pp; English. 98WO-US09691. 97US-0046394 (first entry) Struman I, (REGC) UNIV CALIFORNIA WPI; 1999-045192/04. Beta-NGF can be used to control geriatric dementia and other nervous disorders, and can be released from the fusion protein by incubation with thrombin (see AAN90577-8, AAP91034, AAP91299).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New human nervo growth factor gene encoding fusion protein - having cleavage site for thrombin, useful for treating genatric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human growth hormone segment, used at the N-terminal of a fusion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

It is purified by contacting a gel having a cation exchange qp. with the fusion protein, in the presence of urea. The purified protein is useful in a medicament for treating disorders of the nervous system, eg dementia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention relates to new conjugates, which exhibit growth hormone (GH) activity and comprise at least one non-polypeptide group covalently attached to a GH polypeptide. The amino acid sequence of the conjugates differs from that of wild type human GH in at least one introduced and at least one removed amino acid residue comprising an attactment group for the first non-polypeptide group. The conjugate or pharmaccultual composition is useful for treating a disease or for manufacturing a medicament for treating a disease, e.g. Turner's syndrome. GH deliciency in adults (i.e. GHDA), achondroplasia, chronic renal insufficiency or failure (including renal failure in children), acquired immune deliciency syndrome (ALDS) wasting, cachexia in AIDS patients, or cachexia associated with other diseases. The conjugates are useful ifor treating a variety of disorders caused by growth hormone inadequacy. The present

The invention relates to identifying an unknown active domain in a region of known amino acid sequence in a parent polypeptide e.g. thuman growth hormone (hGH) which has been cloned and has a pre-identified biological activity, where the active domain interacts with a target when the polypeptide is in its native-folded form and the interaction is capposible for the biological activity comprising: (a) comparing the amino acid sequence or polypeptide structure in the region of known amino acid sequence of hGH with the amino acid sequence or polypeptide structure in a region of known amino acid sequence of an analogue polypeptide (e.g. prolact: placental lactogen or porcine growth hormone) which has at leas 18% homology with hGH alpha-carbon coordinates (b) substituting DNA encoding an analogous polypeptide segment from the analogue into DNA encoding the fill length hGH, and expressing a segment-substituted polypeptide; (c) contacting the segment-substituted polypeptide with the target to determine interaction; (d) repeating steps (b) and (c) with a second analogous polypeptide segment; and (e) comparing the difference between activity of the first and second for about 60% of the analogue, sequence, where any interaction of the analogue with the target is different from target interaction with hGH; the unknows active domain in hGH. The method is useful for determining the relationship between structure and function of known polypeptide sequences. The present sequence is that of human growth hormone mutant substituted at functionally important residues and used in Identifying active domains within cloned polypeptides of known amino acid sequence by substituting analog segments into the parent polypeptide is useful to determine the relationship between structure Note: The present sequence is not shown in the specification but was created by the indexer using the mature hGH sequence and information contained in the specification. segment-substituted polypeptides as an indication of the location of Example 16; Page -; 86pp; English. 89US-042H066. 92US-0875204. 92US-0960227. 94US-0190723. the method of the invention. 95US-0483U39 88US-0264611 Wells JA, Cunningham BC: (GETH) GENENTECH INC. Choriomammotropin A precursor [validated] - human
NiAlternate names: chorionic somatomammotropin 1; placental lactuages
Cispecies: Homo saplens (man)
Cispecies: A94422; I52342; A9383; A93192; A90044; A94427; A61283; I55229;
Richen, E.Y. Liao, P.C.; Smith, D.H.; Barrera-Saldana, H.A.; Gellnas, R.E.; Seeburg, Genomics 4, 479-497, 1989
A; Title: The human growth hormone locus: nucleotide sequence, biology, and evolution.

Nat. Genet. 23:373-373(1999).

-I. FUNCTION: Plays an important role in growth control. Its major role in stimulating body growth is to stimulate the liver and other tissues to secrete IGF-1. It stimulates both the differentiation and proliferation of myoblasts. It also stimulates "The X-ray structure of a growth hormone-prolactin receptor complex."; "Characterization of single-nucleotide polymorphisms in coding regions Cargill M., Altshuler D., Ireland J., Sklar P., Ardlie K., Patil N., Shaw N., Lane C.R., Lim E.P., Kalyanaraman N., Nemesh J., Ziaugra L., Friedland L., Rolfe A., Warrington J., Lipshutz R., Daley G.O., MEDLINE-82052997; PubMed-7028740;

Arch. Biochem. Biophys. 245:287-291(1986).
-!- FUNCTION: Plays an important role in growth control. Its major role in stimulating body growth is to stimulate the liver and other tissues to secrete IGF1. It stimulates both the differentiation and proliferation of myoblasts. It also stimulates amino acid uptake and protein synthesis in muscle and other

POL. Biol. Evol. 18:945-95(2001).

POLE UNITION: Plays an important role in growth control. Its major role in stimulating body growth is to stimulate the liver and other tissues to secrete IGF-1. It stimulates both the differentiation and proliferation of myoblasts. It also stimulates amino acid uptake and protein synthesis in muscle and other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      27 FPTIPLSRLLDNAMLRAHRLHQLAFDTYQEFEEAYIPKEQKYSFLQNPQTSLCFSESIPT

linked or non-covalently associated, in homopolymeric and
heteropolymeric combinations. Can also form a complex either with
GRBP or with the alpha2-macroglobulin complex.
-!- SUBCELLUIAR LCATION: Secreted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The human growth hormone ocus: nucleotide sequence, biology, and

"Sequence and expression of hamster prolactin and growth hormone
massenger RNAs."
Endocrinology 129:2065-2971(1991).

-I- FUNCTION: Plays an important role in growth control. Its major
role in stimulating body growth is to stimulate the liver and
other tissues to secrete IGF-I. It stimulates both the
differentiation and proliferation of myoblasts. It also stimulate
amino acid uptake and protein synthesis in muscle and other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

J. 109:19-24(1968).

-!- FUNCTION: Plays an important role in growth control. Its major role in stimulating body growth is to stimulate hiver and other tissues to secrete IGF-1. It stimulates both the differentiation and proliferation of myoblasts. It also stimulates amino and uptake and proliferation synthesis in muscie and other

Submitted (AUG-2000) to the EMBL/GenBank/DDBJ databases.
I-FUNCTION: Plays an important role in growth control. Its major role in stimulating body growth is to stimulate the liver and other tissues to secrete IGF-1. It stimulates both the differentiation and proliferation of myoblasts. It also stimulates amino acid uptake and protein synthesis in muscle and other
